Mining on the Resource-rich Island of Fiji's Viti Levu

Melissa Pistilli - November 3rd, 2019

The Fijian island of Viti Levu offers rich resources and an extensive mining history that are both helping resource companies discover new mineral exploration targets.

Fiji's Viti Levu is rich in minerals and relatively underexplored, making the South Pacific island nation a top frontier mining jurisdiction.

Fiji's prime location along the Pacific Ring of Fire has gifted the country with deposits of **gold**, **copper**, **silver** and **zinc**. Many of the nations located along this chain similarly host massive amounts of mineral resources and have become major mining jurisdictions. For example, the 80-year-old Vatukoula gold mine is a significant contributor to Fiji's economy. Major Australian gold producer Newcrest Mining (ASX:**NCM**) is similarly advancing one of the largest undeveloped copper resources in the world, the Namosi project located on the Fijian island of Viti Levu.
